FUNCTION: REGULATING FACTOR FOR THE PRODUCTION OF EXTRACELLULAR PROTEASES. THE N-TERMINAL REGION ACTS AS AN INHIBITOR, WHEREAS THE C-TERMINAL REGION CARRIES BURANCING ACTIVITY.

SIMILARITY: THE N-TERMINAL REGION IS SIMILAR TO THAT OF OTHER REGULATORY COMPONENTS OF SENSORY TRANSDUCTION SYSTEMS.

SIMILARITY: BELONGS TO THE LUXR/UHPA FAMILY OF TRANSCRIPTIONAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacteria; Firmicutes; Actinobacteria; Actinobacteridae; Actinomycetales; Corynebacterineae; Mycobacteriaceae; Mycobacterium

             ITSSUE SPECIFICITY: EXPRESSION IS HIGHER IN THE ELECTRIC LOBE THAN IN THE POREBRAIN.

DOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE HYDROPHOBIC TRANSMEMBERANE SEGMENTS (51, 22, S3, S5, S6) AND ONE POSITIVELY CHARGED TRANSMEMBRANE SEGMENT (54). S4 SEGMENTS PROBABLY REPRESENT THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION.

PTM: PHOSPHORYLATED IN VITRO BY CAM-KINASE II, CAPK, PKC AND CGPK
                                                                                                                                                                                                                                                                                                                                                                                                                                      Pfam; PF00520; ion_trans; 4.
